# Our Objective: Honda Connected Vehicle Data Analysis and Use

Gather highly valuable V2X interaction data to contribute to future CV system design

## Raw Data

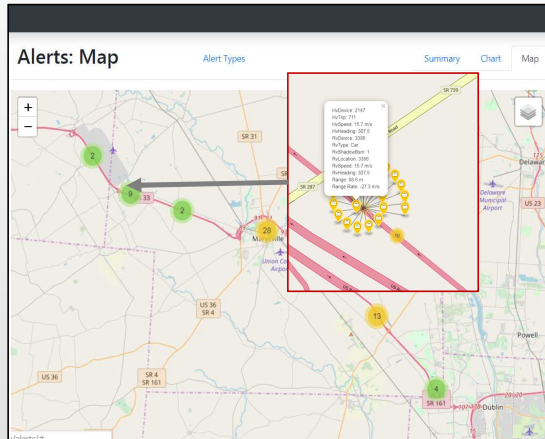

### V2X Data

General	Vehicle type, location, time, etc.
Motion	Heading, speed, acceleration, brake status, light status, airbag status, wiper status, etc.
Path history	
Path prediction	

### V2I Data

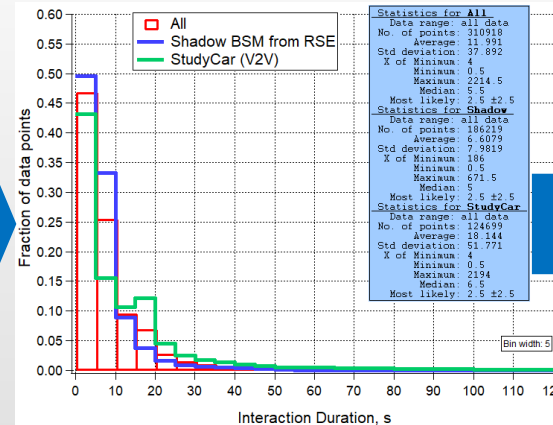

Infrastructure type, location, time, etc.
Traffic signal status
Roadwork detail (lane affected, location, duration, etc.)
Severe weather information

## Data Server

## Analysis Results

Example:  
V2V Interaction Location and Duration

## Future CV System Design

- Density-sensitive app selection
- Effectiveness validation
- Driver expectation

## Infrastructure Growth: The Beginning (2017 – 2018)

5

- A limited number of connected vehicles
- Honda, ODOT, and the City of Marysville built two smart intersections

# Infrastructure Growth: Present

- More than 100 Honda connected vehicles
- ODOT is adding more infrastructure as we speak
- The City of Marysville added several smart intersections

# More Vehicles = Many More Interactions

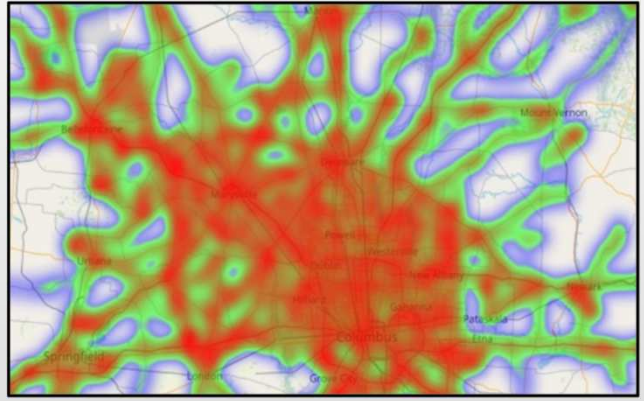

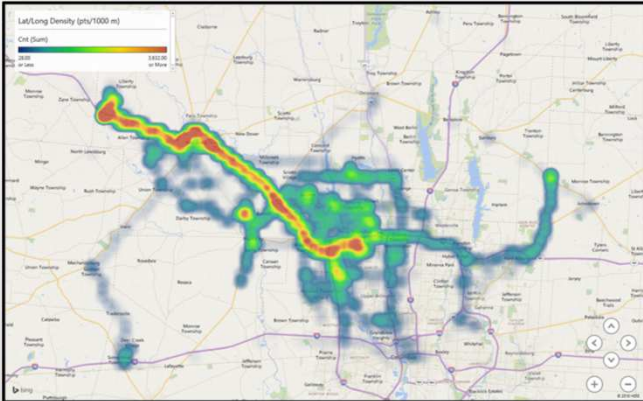

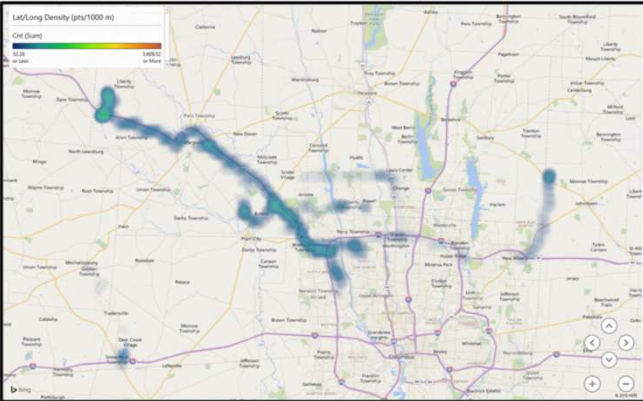

5 Vehicles

25 Vehicles

119 Vehicles (Peak)

(Through April 2020)

**119** Fleet Vehicles (Peak)

**739,001** Miles Traveled

**59,806** Trips

**Vehicle-to-Vehicle Interactions**

**103,934**

Honda Vehicle Interactions

**Driver Warnings**

**1,540**

Total Warnings

**Smart Intersections**

Count: 2

**153,464**

Infrastructure Assisted Detection of Non-V2X Road Users (and some non-Honda CV interactions)

**Signal Phase and Timing (SPaT) Intersections**

Count: 49

**13,099**

Vehicle-to-Infrastructure (V2I) Interactions

**4,679**

Red Lights Encountered by Study Vehicles

# Key Learnings: Alerts Per Application

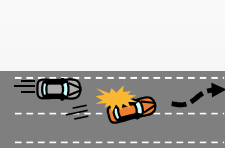

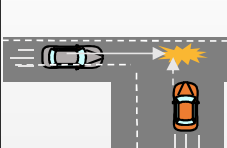

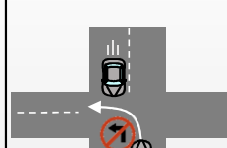

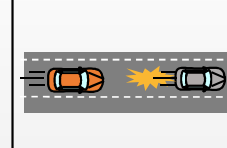

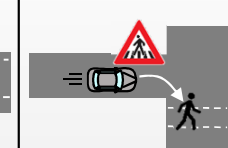

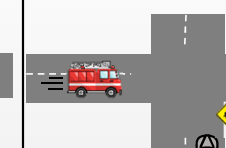

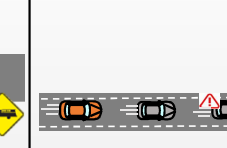

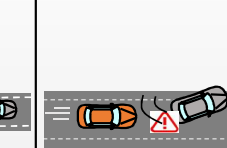

**1,540** Total Warnings

(Through April 2020)

1,346 Inform Warnings

194 Imminent Warnings

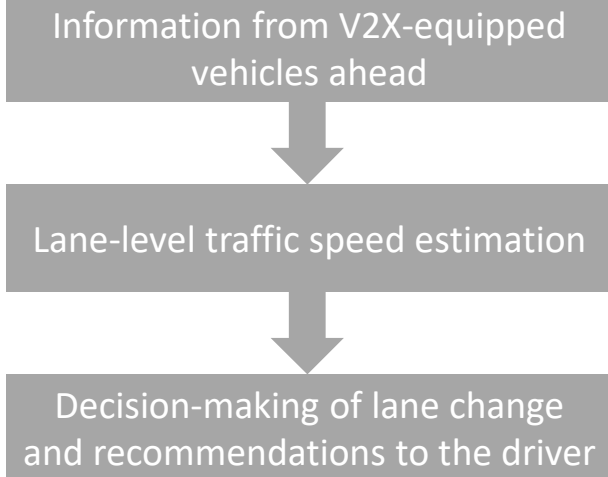

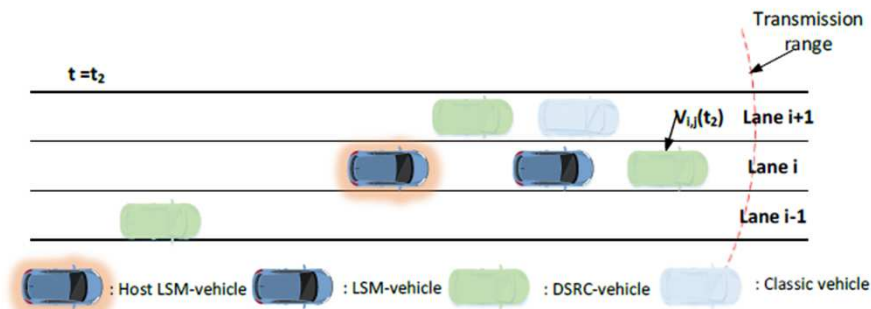

## Warnings Breakdown

Warning Type								
	Blind Spot/Lane Change Warning	Intersecting Collision Warning	Left Turn Assist	Forward Collision Warning	Pedestrian Detection Assist	Emergency Vehicle Alert	Emergency Brake Alert	Control-Loss Warning
<b>Inform</b>	659	544	76	53	0	4	4	6
<b>Imminent</b>	11	96	27	16	21	17	6	0
<b>Total</b>	670	640	103	69	21	21	10	6

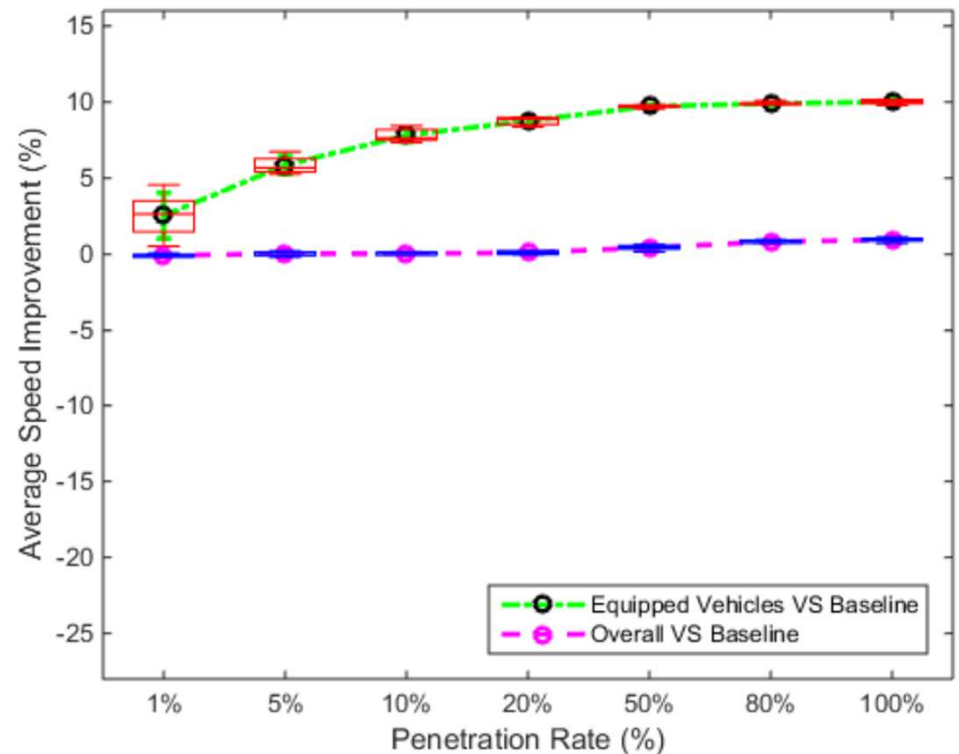

- Honda is working with ODOT to bring new vehicle-to-infrastructure (V2I) applications and warnings

## Other Immediate Benefits: Accurate Lane-Speed Prediction

Our research shows mobility benefits even at a low-V2X-density environment

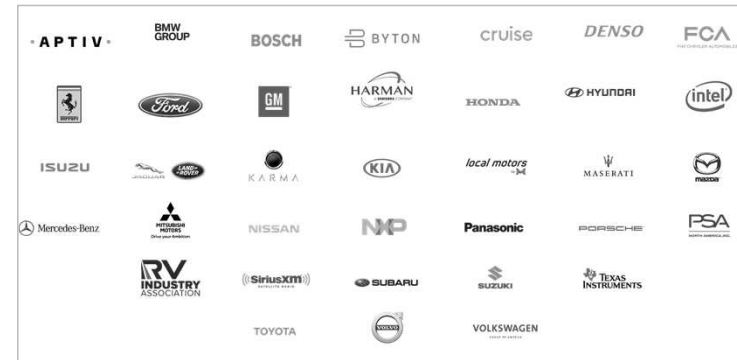

Speed Improvement by Lane-Speed-Monitor

# Challenges to the Frequency Spectrum: 5.9 GHz V2X Spectrum

- **FCC plans to open most of the 5.9GHz V2X spectrum to unlicensed use** (final decision targeted for October '20)
- **Significant interference (↔) impacting V2X performance is expected**
- **7 DSRC Channels → 3 DSRC / LTE V2X channels**
- Industry is actively engaged with FCC to strengthen the message: ***Preserve all 7 channels at 5.9GHz exclusively for V2X safety use***

## Alliance for Automotive Innovation

## 5.9GHz Spectrum

DSRC → Dedicated Short Range Communication  
 LTE → Long Term Evolution (Broadband)

**Current** →

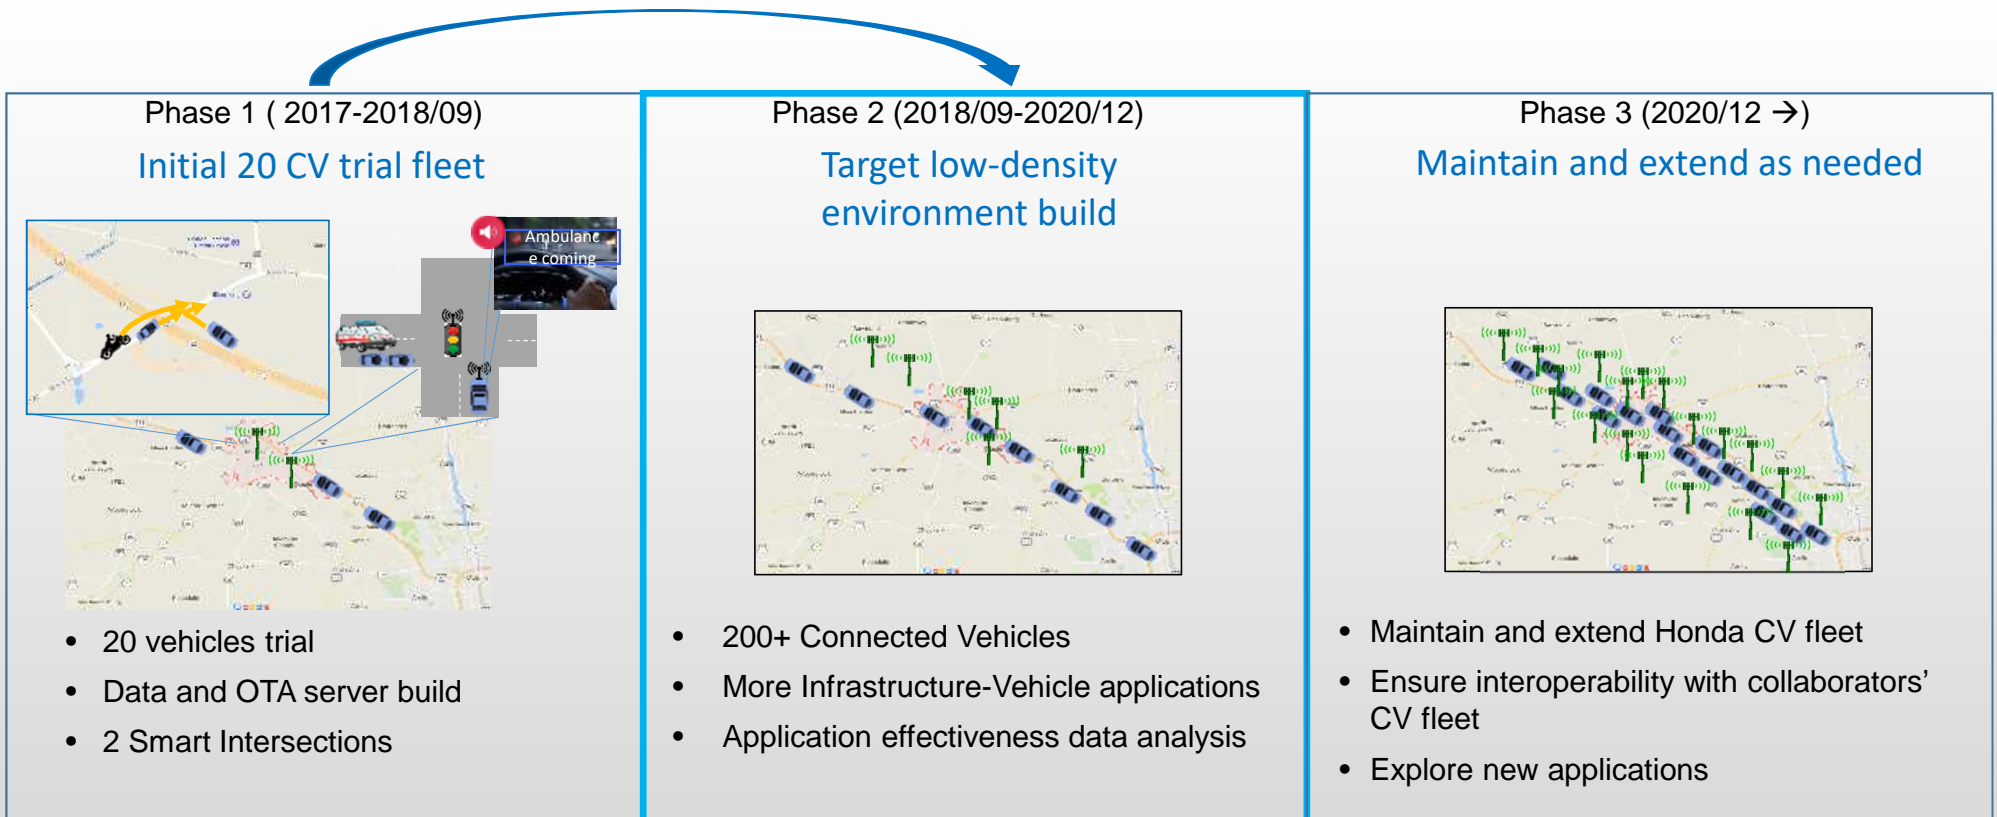

5.855 GHz	5.865 GHz	5.875 GHz	5.885 GHz	5.895 GHz	5.905 GHz	5.915 GHz	5.925 GHz
CH 172	CH 174	CH 176	CH 178	CH 180	CH 182	CH 184	
DSRC V2V Safety	DSRC V2I Safety	DSRC V2P Safety	DSRC Control	DSRC Service	DSRC Service	DSRC Safety	↔ Unlicensed
↔ Unlicensed (WiFi)				↔ DSRC / LTE-V2X	LTE-V2X	LTE-V2X	↔ Unlicensed

**FCC Proposal** →

(Notice of Proposed Rulemaking)

## Looking Ahead: Expand CV Environment as Technology and Infrastructure Mature

- Targeting 200 CV-retrofit vehicles by early 2021
- Add more V2I applications to support ODOT, Marysville and other infrastructure providers
- Open to working with new collaborators and new concepts

## A New Connected Corridor: Michigan's New CAV Corridor

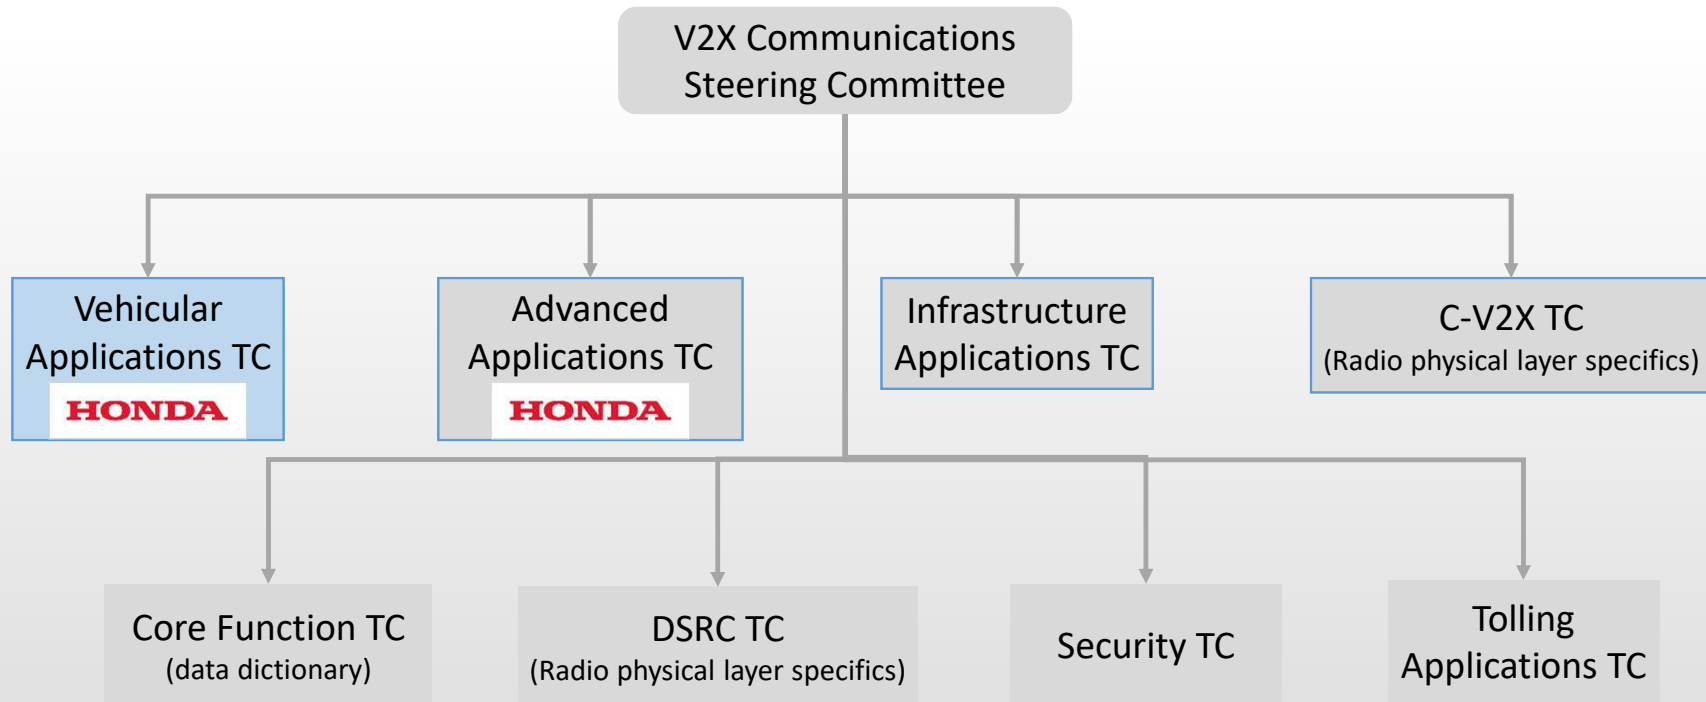

- **Michigan DOT announced a new CAV corridor program**
  - Focusing on CAV deployment with large-scale infrastructure support
- **A great new opportunity to work together**
  - Accelerate CAV deployment in the Midwest region
  - Maintain each state's uniqueness and regional-specific transportation needs

- Smart Mobility Corridor
  - Our Objective
  - Infrastructure Growth
  - Key Learnings
  - Other Immediate Benefits
  - Challenges to the Frequency Spectrum
  - Looking Ahead
  - A New Connected Corridor (Up North)
- SAE V2X Standards Update

# SAE V2X Committee Structure

Scope: Develop and maintain V2X message set and application standards

TC: Technical Committee

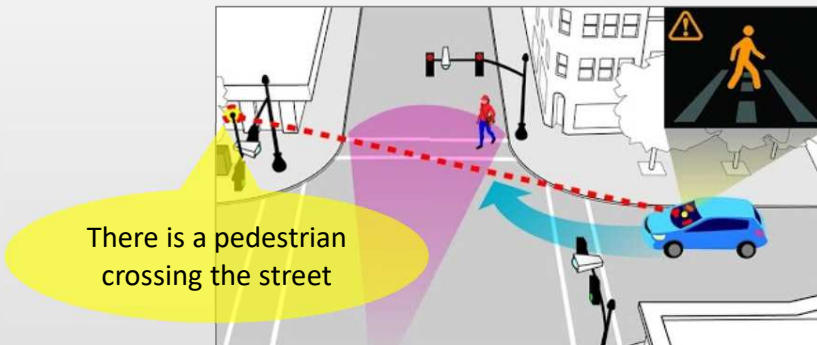

- Enhance Adaptive Cruise Control (ACC) with V2X communication
- New message on dedicated channel to ensure performance and minimize congestion impact from other V2X application transmission
- Include platooning as Phase 2
- Balloting scheduled to start this year

- Vehicle/Infrastructure perception data sharing to enhance ADAS/ADS situation awareness
- Reuse V2V safety message types with different message types and requirements
- Great benefit to V2X early deployment
- Balloting scheduled to start this year

**Example:** Infrastructure detects pedestrian and shares information to V2X-equipped vehicles

**Example:** Vehicle front camera detects non-V2X lead vehicle and shares information to V2X-equipped nearby vehicles

- Enhanced communication between road users has the potential to improve overall road safety
- Define use cases and message protocol for road users and infrastructure to exchange intention and needs
- Plan to start ballot in 3-4 months

## Current Situation: Ineffective Communication

## Road User to Road User Courteous Communication

## Summary

---

- Honda is committed to **expanding CV fleet deployment** and **collaborating with Smart Corridor stakeholders**
- **Let's work together to protect the V2X spectrum** for transportation safety
- As leaders in the Midwest region, let's **collaborate** with our Northern neighbors **to help improve transportation safety and improve society**
- Honda is leading SAE V2X vehicular standards development to **expand safety and mobility benefits to a variety of road users**
- We **welcome inputs** from the stakeholders to **refine the standards**
